                                                                                                                                                                                                                                                                                                                                                                     IFN-gamma is a therapeutically active agent in the treatment of autoimmune disease, allograft transplant rejections, multiple sclerosis, chronic inflammations and delayed hypersensitivity. It also useful in identifying IFN-gamma agonists and antagonists.

This sequence represents the plasmid pDMI.1. This plasmid was used in conjunction with the expression plasmids pDS56/RBSII, -1, and -2. These plasmids contain the regulatable promoter/porator element (N250FSNI50F29 and the ribosomal binding sites (RBS) RBSII, RBSII(-1) and RBSII(-2) respectively. These RBS are derived from the RBS of the promoter pg25 of the B. coli phage TS. These plasmids may be maintained in E. coli play if the promoter/operator element is repressor is encoded by the lacingenessor to the operator. The lac repressor is encoded by the lacingenessor to the operator. The lac repressor is encoded by the lacingenessor to the operator. The lac repressor is encoded by the lacingenessor to the operator. The lac present in the calls. Therefore the lacing allele, which contains a promoter mutant responsible for increased expression of the repressor contains the neowych phosphotransferase gene from the plasmid pACYC184 which contains all the information required for the plasmid between bases 1-1120 contains the replication and stable transmission to daughter cells. The region of these plasmids between bases 1-1120 contains the replication region and the gene for beta-lactamases gene is mediated by elimination of the Hincill and Petl cleavage sites. These plasmids also contains the enzymes Sall, Petl and Hindill,

The modified fragment was inserted into each of pDS56/RBSII, pDS56/RBSII-1, and pDS56/RBSII-2. Plaemids contg. the inserts in both possible orientations were transformed into E. colistrain MIS carrying the compatible pDMI.1. The E. colistrain MIS contg. plasmids pSD56/RBSII and pDMI.1 is described in EP-316695.

This vector includes a neomycin phosphorransferase gene as a selectable marker, an Escherichia coll origin of replication (oric from pUC129), a phage T5 promoter sequence, 2 lac operators (see also AAV33722), a Shine-Dalgarno sequence, the lactose operon repressor gene (lacig) and a multiple cloning site linker region. Expression of operatively linked sequences located downstream from the lac operators may be induced by addition of a lac operon inducer such as IPTG. pHE4 vectors have been produced that include the coding sequence (see AAV3367) for novel human thymus receptor tyrosine kinase (TRIK, see AAW70525-26). These can be used for the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the nucleotide sequence of plasmid pHB4a (ATCC 209645). It includes a neomycin phosphotransferase gene as selectable marker, an Bscherichia coli origin of replication, a TS phage promoter sequence, 2 lac operator sequences, a Shine-Delgarno sequence, the lactose operon repressor gene (laciq) and a multiple cloning set lite linker region. A muleotide sequence (see AAV66356) codaing for novel human cardiac and pancraatic protein (ARP, see AAW80212) can be operatively linked to the promoter and operator (see AAV66373) of pHB4a, and CAPP expressed in E. coli cells following IPTG induction. CAPP polypeptides can modulate the differentiation and products can be used in the diagnosis and treatment of pancreatitis and conditions that cause abnormal hypertrophy of the heart, such as hypertension, mycoardial infarction, valve disease and cardiomyopathy. The products can also be used in detection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    2579 CGCTGGAGGATCATCCAGCCGGCGTCCCGGAAAACGATTCCGAAGCCCAACCTTTCATAG

 production of recombinant TRTK polypeptides in bacterial host cells
                 The invention provides TRTK polynuciectides and polypeptides, vectors, host cells and recombinant methods of producing these. Also provided are diagnostic methods for detecting disease states associated with the aberrant expression of TRTK and therapeutic methods for treating such disease states, especially cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence is plasmid pHE4-5 which is used in a method to isolate and characterise a human RNA polymerase II elongation factor ELL2 which can be used in the design of treatments for neoplastic disorders (especially leukaemias). Antagonists of the polypeptides or nucleic acids that inhibit the expression of the protein, can be used to inhibit ELL2 susceptibility to neoplastic disorders comprises assaying ELL2 asspression level in mammalian calls or body fluid and comparing these expression level in mammalian calls or body fluid and comparing these indicates an increased or decrease or decrease in levels indicates an increased or decreased susceptibility. The gene expression level is assayed using the antibody, or by detecting ELL2 mRNA levels. The host cells of may be used to identify compounds which bind to an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

The present sequence represents pHB405 vector which contains human myelin oligodendrocyte glycoprotein-like protein (MOGp). The presence of MOGp on the surface of oligodendrocytes is associated with oligodendrocyte maturation and with the production of myelin. Products from the present invention can be used for the diagnosis, prognosis and treatment of e.g. cancers, inflammation, or demyelinating disease such as multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              TCTCGGCAGGAGCAAGGTGAGATGACAGGAGATCCTGCCCCGGCACTTCGCCCAATAGCA

lac operators, a Shine-Dalgarno sequence, and the lactose operon repressor gene (lacig). The newly isolated human breast cancer specific gene 1 (BCSP1, see AAV42669) can be operatively linked to the promoter and operator by insertion between the NdeI and Asp718 sites of the vector, allowing recombinant production of BCSP1 polypeptide (see AAW63123) in host cells. BCSP1 is useful as a breast cancer progressive marker. BCSP1 polymucleotides, polypeptides and antibodies can be used to develop products for the diagnosis, clinical management and treatment of breast cancer and metastasis.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 37, P
